Now you try: Create a dictionary of at least five contacts with first names and phone numbers, sort the list in alphabetical order, and print the contacts with their phone numbers.

```
In [35]: phone = {'jake' : '123-456-7891', 'mandy' : '123-776-7891', 'bailee': '894-456-7891',  
                #Keys, Values, Items  
                print('-----')  
                print('Using Index')  
                print('-----')  
                for key in sorted(phone):  
                    print(key, phone[key])  
  
                print('-----')  
                print('Using keys/values')  
                print('-----')  
                for key,value in phone.items():  
                    print(key,value)
```
